

HORADAM® AQUARELL – Special edition „supergranulation colours“ 2 new series: Tundra and Forest

Following the great success of the three special series HORADAM® AQUARELL „Supergranulating Colours“, Schmincke has now succeeded in formulating **two further special editions** in which supergranulating effects can be achieved in additional colour ranges. The new series „**Tundra**“ and „**Forest**“ each contain 5 colours and complement the three previous series „Deep Sea“, „Glacier“ and „Galaxy“ in the most beautiful way.

The colours of the „Forest“ series are suitable for painting all kinds of forest in a wide range of shades of granulating green. With the series „Tundra“, Nordic, harsh landscapes can be captured just as beautifully as exotic travel impressions of rather dry regions. Both series complement the existing 15 HORADAM® supergranulating colors to the finest and together form a range with inexhaustible potential.

What is granulating?

Granulation is the property of pigments to agglomerate on the paper. The combination of at least 2 granulating HORADAM® pigments enhances this effect to „supergranulation“. In the case of pigments from different colour ranges, the colour interactions are further intensified. For example, the colour „**Tundra Violet**“ (14 983) is a **combination of brown and blue pigment**, while „**Forest Grey**“ (14 945) **contains a black, a brown and a green pigment**. **Please note!** This novel, natural structure formation of the colours varies depending on the substrate and the amount of water used. The rougher a paper is, the stronger the granulation effect.
